  Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAL Plate: 40 Row: h Column: 5 This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity to protein.

  Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAL Plate: 40 Row: n Column: 11
This clone was selected for full length sequencing because it passed the following selection criteria: GenomeScan gene prediction, Similarity but not identity to protein.

AČENCOURT\_8484950 NIH\_MGC\_113 Homo sapiens cDNA clone IMAGE:63010415', mRNA sequence.

ACCESSION

```
/note=Organ: spleen; Vector: pOTB7; Site_1: XhoI; Site_2: EcoRI; cDNA made by oligo-dT priming. Directionally cloned into EcoRI/XhoI sites using the following 5' adaptor: GGCACGAG (3). Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies). Note: this is a

   Gaps
  2 DNA sequences (AAT62509 and AAT62510) respectively code for primatised forms (AAW01817 and AAW01818) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antignem monoclonal antibody 7C10. Cloned 7C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO calls. Primatised 7B6 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders
                                   monoclonal antibody binding human B7.1 or B7.2 antigen for treating autoimmune disease or graft-versus-host disease

trom macaque. This sequence is used in a method which studies new monoclonal antibodies (MAb's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens to CD88 such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B call interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type inflammatory bowel disease, allerty and multiple sclerosis, graft vs. host disease, B cell lymphoma, infections (including by human immune construction true) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleuvin-2.7. T cell proliferation and

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD86) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopania purpura, systemic lupus, erythemacosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anamia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-hoot disease. The antibody is useful for immunosuppression or graft-ve-hoot disease. The antibody is useful for immunosuppression or graft-ve-hoot disease. The antibody is useful for immunosuppression criman or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive and hyperproliferative diseases, for treating reversible obstructive disease and ulcerative colitis, food-related allergies e.g. migraine, thinitis and eczema, and other types of allergies. The present nucleic cail sequence encodes the light chain of 7010, a primatised antibody used in the invention to induce apoptosis and inhibit production of interleukin-2 (IL-2).
   Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

A DNA sequence (AAT62867) codes for lambda variable and constant domains (AAW14924) of anti-human CD4 monkey/human chimeric antibody CB9.1. This antibody contains the antigon binding domains (see also AAW14922-23) of a cynomolgus monkey anti-CD4 monoclonal antibody, a human heavy chain constant region of gamma 1 isotype and Gm12, GM1z allotype, and a human lambda light constant region of the Oz minus, mcg minus genotype and Ke minus allotype. The immunoglobulin genes were cloned into mammalian expression vector

TCAE 6, and chimeric antibody was produced in CHO cells. CE9.1 binds to domain 1 of human, but not macaque, CD4, a region involved in the interaction with MHC class II molecules on antigen-presenting cells. It shows potent immunomodulatory activity with low immunogenicity in humans, and can be used to treat autoimmune diseases such as rheumatoid arthritis.

  This invention describes novel polypeptide fragments (I) and the polymucloctides (II) that encode them that are highly expressed in a human bladder tumour and which have eyvosetatic activity. (II) are used to recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for treatment of bladder cancer, to directly treat this form of cancer (including expression from gene therapy vectors) or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTB (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures associated with the fact that therefore reduces the number of failures associated with the fact that who was gene, distorting the estimated frequency of occurrence in a particular tissue. And 21806-243109 represent expressed sequence tag (EST) fragments isolated from a human bladder tumour cDNA library which encode the proteins represented in AAV66143-V66198.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating

This sequence encodes a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new conclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving CT cell/B cell interactions, particularly autoimmune diseases, specifically idiopathic thrombocytopaenia purpura, systemic lupus srythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, confiding to work allergy and multiple selectosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the NAD can be confugated to a drug or toxin. MAD's or their fragments, can also be used as imaging agents and as vaccines or immunosquens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and tipelic immunosuppression.
                T cell/B cell interaction; tumour; inflammation; imaging agent; vaccine; immunogen; anti-idiotype reagent; interleukin-2; IgG; immunoglobulin G; T cell proliferation; 88.

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of .B7 the invention is concer inducing the apoptosis of .B7 the invention is a cancer where B calls promote the growth and/or metastasis of tumours, B call lymphoma, B call lawtzenia, and autoimmune diseases Buch as a chicharth thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's classes and ulcerative diseases, for treating reversible obstructive disease, and other types of allergies e.g. migraine, chintis and eczema, and other types of allergies. The present nucleic acid sequence encodes the light chain of 16c10, a primatised antibody used in the invention to induce apoptosis and inhibit production of

  2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAM01821 and AAW01822) of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 16C10.

16C10. Cloned 16C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy thain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

  The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABP4131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer, and breast cancer, and metastatic tumnours of ovarian or preventing varian cancer, and becast cancer, and ametastatic tumnours of ovarian or press of pregnancy, anovulation, disorders (e.g., infertility, disorders of pregnancy, anovulation, polyorgetic ovary syndrome, ovarian cysts, and dysmenorines, and toxic disorders, infections (e.g., chiamqdia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginitis), immune disorders (e.g., congenital and acquired impuned disorders, natedial and acquired impuned disorders, natedial and acquired impuned disorders, natedial and acquired impuned disorders (e.g., congenital and acquired impuned polypeptides and uninary system disorders. ovarian antigen polypeptides and uninary system disorders. ovarian antigen polypeptides and uninary system disorders. ovarian antigen polypeptides may be used for gene therapy, chromosome mapping, in the modulate ovarian antigen expression or activity. The polymcleotides may be used as food additives or to prepare antibodies encored in sequence represents cDNA encoding a human ovarian antigen of the invention

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymeras chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or

Human cDNA encoding secreted potein SECP38.

```
;
quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensiss, gene mapping, identification of mutations responsible for genetic disorders and products dependent on DNA and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences.

The invention relates to forty four human secreted proteins (referred to as SECP-1 to SECP-44) and the nucleic acids encoding them. Also included are a host cell transformed with the nucleic acid, a transgenic animal comprising the nucleic acid, an anti-SECP actions of the SECP proteins in isolating agonists and antagonists of SECP activity and a method of isolating compounds which alter the comprehension of the SECP nucleic acid. The SECP polynucleotides and polypeptides are useful in the diagnosis, treatment and prevention of cardiavascular (e.g. atherosclerosis, hypertension, myocardial infarction), allergates, rheumatoid arthritis), cell proliferative (e.g. cancer), developmental (e.g. buchenne and Becker muscular dispersion of dispropers. Numerous other examples of each disorder are given in the specification. The present sequence is a cDNA encoding a SECP protein.
   Forty four human secreted proteins (referred to as SECP-1 to SECP-44), useful in the diagnosis, treatment and prevention of cardiovascular (e.g. atherosclerosis), autoimmune/inflammatory (e.g. allergies) and cell proliferative disorders

The invention relates to polynuclectides encoding novel human proteins or their active domains. The polypeptides, polynuclectides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynuclectides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine parcialet protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet ingement and/or nerve tissue, wound healing, treating burns, promoting the prolifezation, differentiation and survival of stem cells, as as a contraction and survival of stem cells, as as contraction and survival of stem cells, as as contraction and survival of stem cells, as as contraction and survival of stem cells, as a contraction and survival of stem cells, as a contraction, treating osteoporosis and osteoarthritis, ansemia, and function in survival of stem bacterial, viral or figures; in the invention of the prolifezation, differentiation and survival of stem bacterial, viral or figures; in the prolifezation, differentiation and survival of stem ceptical, viral or figures; it can bunching or a diseases, amplocrophic lateral or figures.

  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polyapeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. (I polypeptide and polymucleotide sequences have applications in disponsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO.

The invention relates to polymuclectides encoding novel human proteins or their active domains. The polypeptides, polymuclectides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as manderes food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the polypeptides. Polypuclectides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine palological activity, to target drugs of the invention may also be useful in treating platelet protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet alganete and/or merve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, alganete serue and function or from autoimmunity, cancer, allergy, asthma, graft-versue-host disease, eczema, heamophilia, thrombosis, and infection. The process is nervous system disorders, and infection.
   Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage
   The present sequence encodes a protein of the invention.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  HOU22823 895 bp mRNA linear PRI 07-FEB-2002
Homo saplens, clone MGC:39283 IMAGE:4856249, mRNA, complete cds.
BC022823
  found
   Steven Jones, Jennifer Asano, Ian Bosdet, Yaron Butterfield, Susanna Chan, Readman Chiu, Chris Fjell, Erin Garland, Ran Guin, Letticia Helso, Martin Krzywinski, Reta Kutsche, Oliver Lee, Soo Sen Lee, Victor Ling, Carrie Mathewson, Candice McLeavy, Steven Ness, Pawan Pandoh, Anna-Liisa Prabhu, Parvaneh Saeedi, Jacqueline Schein, Duane Smailus, Michael Smith, Lorraine Spence, Jeff Stott, Michael Thorne, Miranada Tsai, Nataja van den Bosch, Jill Vardy, George Yang, Scott Zuyderduyn, Marco Marra.
   Clone distribution: MGC clone distribution information can be four through the I.M.A.G.E. Consortium/LINL at: http://image.llnl.gov Series: IRAL Plate: 42 Row: g Column: 21
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity
   Chordata; Craniata; Vertebrata; Buteleostomi; Primates; Catarrhini; Hominidae; Homo.
   Submitted (04-FEB-2002) National Institutes of Health, Mammalian Gene Collection (MGC), Cancer Genomics Office, National Cancer Institute, 31 Center Drive, Room 11A03, Bethesda, MD 20892-2590,

  Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov esteis: IRAK Plate: 64 Row: f Column: 10
This clone was selected for full length sequencing because it passed the following selection criteria: GenomeScan gene
  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eureleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

XX

Monkey monoclonal antibody binding human B7.1 or B7.2 antigen - useful for treating autoimmune disease or graft-versus-host disease

XX

XX

Claim 7; Fig 8B; 81pp; English.

XX

CC

primatised forms (AAW01817 and AAW01818) of the light and heavy chains of grammal antibody anti-human B7.1 antigen monoclonal antibody

CC

primatised forms (AAW01817 and AAW01818) of the light and heavy chains of grammal antibody anti-human B7.1 antigen monoclonal antibody

CC

n expression vector (pref. NEOSPLA) which contains human light and

cheavy chain constant region genes to allow profn. of primatised

cn expression vector (pref. NEOSPLA) which contains human light and

cheavy chain constant region genes to allow profn. of primatised

cn expression antibodies nave also been produced (see also AAW01819-22). The

cr primatised antibodies inhibit the B7:CD28 pathway, making them

cc primatised antibodies inhibit the E7:CD28 pathway, making them

cc and graft-versus-host disease.

Hanna N;

This sequence encodes a primatized form of the antibody 7C10 heavy chain from anagaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such CC Mab's are specific immunosuppressants for treatment of diseases involving I call/A cell interactions, particularly autoimmune disease, specifically idopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple selectosis, graft vs. CC inflammatory bowel disease, allergy and multiple selectosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune CC Mab conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and caning antigen-specific immunosuppress.

```
The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD86) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7 + cells. The invention is conservable to relating the apoptosis of B7 + cells. The invention is a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell lymphoma, B cell lymphoma, B cell lymphoma, a sell lymphoma is a cancer where B cells promote the growth and/or metastasis of tumours, C idiopathic thrombocytopenia purpura, systemic lupus, erythematosus, crype I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allersy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive disease and ulcerative colitis, food-related allergies e.g. magraine, chinitis and eczema, and other types of allergies. The present nucleic acid sequence encodes the heavy chain of 7CLO, a primatised antibody used in the invention to induce apoptosis and inhibit production of
  Human, macaque monkey, light chain, primatised antibody, 7C10 antibody, neuroprotective; apoptosis inducer; allergy; CD28 receptor antagonist; B7 a antigen; CD80; B7 antigen; CD86; B cell cancer; metastasis; tumour; B cell lymphoma; B cell leukaemia; autoimmne disease; graft-va-host disease; immunosuppression; organ rejection; interleukin-2; IL-2; mutant; ds.
   DNA sequence of a primatised form of the heavy chain of 7C10 antibody.
   Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as
   of 7C10 antibody"

chains

2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAW01821 and AAW01822) of the light and heavy chair of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 16C10. Cloned 16C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 antibody and antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, maxing them useful immunosuppressants for the treatment of autoimmune disorders

e.g. graft rejection or tumours

```
This sequence encodes a primatized form of the antibody 16C10 heavy chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (NAb's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such SAP's are specific immunosuppressants for treatment of diseases involving CC T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpure, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpure, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpure, systemic lupus erythematosus, theumatory bowel disease, allergy and multiple sclerosis, graft vs. Inflammatory bowel disease, allergy and multiple sclerosis, graft vs. con care to be conjugated to a drug or toxin. NAb's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. NAb's are optionally combined with other proteins or small molecule immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and continents interleukin-2 (IL-2), T cell proliferation and continents immunosuppression, i.e. it inhibits continents procession antigen-specific immunosuppression.

```
The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metaetasis of tumours, C ancer where B cells promote the growth and/or metaetasis of tumours, C ancer where B cells promote the growth and/or metaetasis of tumours, C ancer where B cells promote the growth and/or metaetasis of tumours, C and patchic thrombocytopenia purpura, systemic lupus, erychematosus, CC type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative colitis, food-related allergies e.g. Crohn's disease and ulcerative colitis, food-related allergies of crohn's trinits and ezcama, and other types of allergies. The present nucleic acid sequence encodes the heavy chain of 16Cl0, a primatised antibody curvey.

Human; immune system molecule; ISMO-2; Incyte clone 2849752; diagnosis; treatment; prevention; cell proliferation; immune system disorder; ss.
  Immune system molecules used in the diagnosis, treatment and prevention of disorders associated with the immune system and cell proliferation
   The present sequence is a cDNA encoding an immune system molecule, ISMO-2 from an Incyte clone 2849752 isolated from the human breast tumour cDNA library (BRSTUTT13). This sequence is expressed in several libraries, generally those associated with cancer, cell proliferation, immune response or trauma. The present sequence is useful in the diagnosis, treatment and prevention of disorders associated with the immune system and

  The sequences given in AAT18059-60 encode the heavy and light chains respectively of a monoclonal antibody against a 65 kD antigen of human cytomegalovirus (hCMV). These sequences were amplified using the sequences given in AAT18040-58. The monoclonal antibody may be used in the diagnosis of hCMV.

can be
   New human immune system associated proteins (HISAP) and polynucleotides encoding the HISAP, useful for diagnosing, treating or preventing immune or cell proliferative disorders or infections
  The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISAPs). These can used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosclerosis,

  TGGTTCTTCCTCCTCCTGGTGGCAGCTCCCAGATGGGTCCTGTCCCAGGTGAAGCTGCAG 72
  The human monoclonal antibody D7C2, of isotype 1gM, recognises a 30-32 kD polypeptide on the membrane of rhesus positive red blood cells. The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in new-born rhesus positive babies. Recombinant IgM-D7C2 can be produced by insect cells which have been transformed by a baculoviral vector comprising a D7C2 expression cassette. The present sequence encodes a recombinant IgM-D7C2 heavy chain fused to a mouse VH signal peptide.

  DNA sequences (AAT62868-70) respectively code for the heavy chain regions of human gamma-4 (AAM14925), gamma-4E carrying the L236E mutations.

Mutations. They can be used to provide novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4F. (DE9 gamma-4F and CE9 gamma-4F, in which the human IgG4 FC binding domain framework is combined with the antigen binding domains (see also AAM14922-23) of macaque anti-human CD4 monoclonal antibody E9-1. These antibodies show high affinity to human CD4, have little or no immunogenicity in humans and show reduced or absence of effector function. The gamma-4B and -4PE mutations confer activity enhanced stability and aliminate depleting activity. The antibodies can be used to treat

The present sequence encodes a single chain antibody of the invention. The specification describes a substance can inhibit the binding between hepatitis C virus (HCV) and cells with potential HCV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV BZ/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope GJycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment and/or prevention of hepatitis C, or for diagnosis of hepatitis C.

  A DNA sequence (AAT61241) codes for a polypeptide (AAW11639) comprising a leader sequence, RF1 heavy chain variable region (see also AAW11637), and human gamma 1/constant region. RF1 is a human monoclonal antibody (hMAb) specific for the fusion protein of respiratory syncytial virus (RSV). The DNA sequence, in vector NBCSPEAA, can be used to produce the light chain construct in transfected eukaryocic (e.g. (CH) cells. RF-1 and RF-2 heavy and light chain constructs (see also AAT61240, AAT61242, AAT61279) are

  CD86; inhibitor; immunosuppressant; treatment; autoimmune disease; IL-2; T cell/B cell interaction; tumour; inflammation; imaging agent; vaccine; immunogen; anti-idiotype reagent; interleukin-2; IgG; immunoglobulin G; I cell proliferation.
  2 Polypeptides (AAW01817 and AAW01818) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 7C10. Cloned 7C10 light and heavy variable genes (see also AAT62509 and AAT62510) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibody in e.g. CHO cells. Primatised 7B6 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders

This sequence represents a primatized form of the antibody 7C10 light chain from macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method on the studies new matipodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigons and inhibits binding of these antigons to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autofinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus exythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, instantanto bowel disease, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or thair fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressante. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppress.

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+cells. The invention is cancer to retain the apoptosis of B7+cells. The invention is cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell lymphoma, B cell lymphoma, B cell lymphoma, B cells promote the growth and/or metastasis of tumours, idopathic thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple solerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or lissue for treating proliferative airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's chinitis and eczema, and other types of allergies. The present protein sequence represents the light chain of 7010, a primatised antibody incolucion of interview. The invention to induce apoptosis and inhibit production of

A polypeptide (AAW14924) comprises the lambda variable and constant comains of anti-human CD4 monkey/human chinneric antibody CE9.1.

This antibody contains the antigen binding domains (see also AAW14922-23) of a cynomolgus monkey anti-CD4 monoclonal antibody, a human heavy chain constant region of gamma 1 isotype and GMla, GMlz allotype, and a human lambda light constant region of the Oz minus, cog minus genocype and Ke minus allotype. The immunoglobulin genes comes minus comes minus and Kenfalon antibody was produced in CHO cells. CE9.1

CASE 6, and chimneric antibody was produced in CHO cells. CE9.1

Chinds to domain 1 of human, but not macaque, CD4, a region involved in the interaction with MHC class II molecules on antigento in the interaction with mans, and can be used to treat autoimmune clow immunogenicity in humans, and can be used to treat autoimmune

233 AA;

Sequence

Chimeric antibody comprising monkey variable domains and human constant domains - affects CD4-mediated immune functions, esp. useful for treatment of autoimmune disease, e.g. rheumatoid

```
which specifically binds to B7.1 antigen (CDB0) and/or B7.2 antigen (CDB6) for inducing the apoptosis of B7+ cells. The invention is useful for treating diseases such as Cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopenia purpura, systemic lupua, erythematosus, type I diabetes mellitus, rheumatoria systemic lupua, erythematosus, type I diabetes mellitus, rheumatoria atthitis, psoriasis, aplantic anaemia, inflammatory bile disease, alergy, multiple sclerosis or graft-vershost disease. The antibody is useful for immunosuppression or a human or animal and for treating or preventing resistence to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative colitis, food-related allergies e.g. migraine, rhinitis and eczema, and other types of allergies. The present protein sequence represents the light chain of 16Cl0, a primatised antibody used in the invention to induce apoptosis and inhibit production of
  Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

   The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to CDNAs encoding them (ABQ54131-ABQ56305), and also CC ABP43228) and to CDNAs encoding them (ABQ54131-ABQ56305), and also CC encompasses polypeptides 90% identical and polypucleotides 90% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens and the use CC polynucleotides, antibodies against human ovarian antigens and the use Cf ovarian antigens in diagnosing, treating, prognosing or preventing various ovary and/or breast related disorders Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, cd isorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertility, disorders of e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunofficiencies, autoimmune oophoritis, spetemic lupus erythematosus), cloderstatory disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and oplymented ovarian antigen expression or activity. The polymucleotides may be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used and in forensic analysis, and the control represents a human ovarian antigen of the invention. The printed sequence cate for gase therapting and phenotyping. 2 Polypeptides (AAW01821 and AAW01822) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human bB7.1 antigen monoclonal antibody 16C10. Cloned 16C10 light and heavy variable genes (see also AAT62512 and AAT62513) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

   The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a timour, in assays to determine biological activity, to target drugs to a timour, in assays to determine biological activity to target drugs to a timour, and manne response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, trem cell disorders, regenerating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating otercopronsis and osteoarthritis, anaemia, allabmer's Parkinson's and Huntington's diesase, amylotrophic lateral sclergais, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graft-vérsus-host diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention.

  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and priners, for sequencing, for chromsome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Companies of the invention may also be useful in treating platelet disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anemala, and thusinger sesulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, cantillammatory disease, nervous system disorders, and infection.

   March 29, 2003, 09:06:23 ; Search time 21.223 Seconds (without alignments) 2271.829 Million cell updates/sec
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence represents a primatized form of the antibody 7B6 heavy chain from macaque. This sequence is used in a method which studies new moncolonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibite binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cells eall interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaemia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple selectosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7(CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and suddieses.
New monoclonal antibodies specific for B7.1 or B7.2 antigens and inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between T and B
  cells, e.g. graft rejection or tumours
  Example 7; Fig 4b; 87pp; English.

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as Gidiopathic thrombocytopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammancy bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistence to or rejection of transplanted organ or Lissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease intestinal inflammations and allergies e.g. migraine, disease and ulcerative colitis, food-related allergies e.g. migraine, sequence represents the heavy chain of 786, a primatised antibody

   2 Polypeptides (AAW01819 and AAW01820) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 7B6. Cloned 7B6 light and heavy variable genes (see also AAT62511 and AAT13847) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. Of the primatised antibody in e.g. CHO cells. Primatised 7C10 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01817-19 and AAW01821-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

   producing human MAbs specific for the gp120 V3 loop of HIV-1 MN isolate were obtained. MAb 447-52D was found to recognise the tetrapeptide motif GPGK, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain V region was derived from 447-52D and to which a signal sequence and a H chain intronic sequence are appended, fused to a fragment coney. a short intronic segment of the human gamma 1 C region and the human gamma

antibody fragments covalently attached to one or more nonproteinaceous polymer molecules, where the apparent size of the conjugate is at least about 500 kpa. Conjugates of antibody fragments which bind the human interleukin (IL) 8 with a nonproteinaceous polymer can be used for treating inflammatory disorders e.g. acute lung injury, ischaemic reperfusion disorder, and autoimmune diseases. They can also be used for treating e.g. inflammatory skin diseases including psoriasis and atopic dermatitis, systemic soleroderma and sclerosis, and asthmatic diseases. The conjugates can also be used as reagents in an animal model system for in vivo study of the biological functions of the antigen recognised by the conjugate. The present sequence represents a recombinant immunoglobulin protein from the present invention.

The invention relates to an anti-interleukin-8 (IL-8) monoclonal antibody (MAb). The anti-IL-8 MAb comprises a sequence containing the CDRs (complementarity determining regions) of the humanized anti-IL-8 6G4.2.5V1N35A light chain; and amino acids 24-253 of the humanized anti-IL-8 6G4.2.5V1N35A heavy chain. The anti-IL-8 MAbs and fragments and be used in diagnosis, for affinity purification of IL-8 from recombinant cell culture or natural sources and for the treatment of inflammatory disorders e.g. adult respiratory distress syndrome. Nucleic acids encoding the anti-IL-8 MAb can be associated in a vector with

  human rabies-immune globulin; monoclonal; virucide; heavy chain; monoclonal rabies virus neutralising antibody; immunoglobulin; chain; central nervous system; CNS; prophylactic therapy; clone JA.
  This sequence represents the heavy chain protein of the monoclonal antibody from clone JA. The invention relates to an isolated human monoclonal rables virus neutralising antibody (virucide) derived from CDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified away from deleterious contaminants. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for

The invention relates to polynuclectides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides recombinate to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Contraceptides of the invention may also be useful in treating platelet disorders, stem cell disorders, readenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting contraceptive, treating osteoporosis and osteoarthritis, and an expersion, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anemia, and infection or from autoimmunity, cancer, allergy, asthma, the intramment and infection. The propertion of the prolimential, thrombosis, and infertion.

This polypeptide is encoded by vector plasmid p664v11N35A.choSD.9

(See AAV44956). It comprises a humanised 6G4v11N35A igg containing complementarity determining regions of murine anti-interleukin-8

(IL-8) monoclonal antibody (MAD) 6G5.2.5 (see AAV69309-10) in a human complementarity determining regions of murine anti-interleukin-8

(IL-8) monoclonal antibody (MAD) 6G5.2.5 (see AAV69309-10) in a human complement. Humanised anti-IL-8 MADs (see AAV69309-10) in a human complement of inflammatory disorders. The invention provides conjugates of an intibody fragment and a polymer, such as PEG, that have improved half-life, mean residence time, and/or clearance rate. The conjugates can be used for immune therapy of e.g. psoriasis, responses associated with inflammatory bowel disease (such as Crohn's disease and ulcerative colitis), isohemic reperficiation, adult respiratory distress syndrome, dermatitis, meningitis, encephalitis, uveitis, autoimmune diseases such as rheumatoid

   The invention relates a humanised antibody that specifically binds an epitope contained within positions 13-28 of amyloid beta peptide, Abeta. The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of toxic soluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes the prolonged expression of recombinant sequences of them in human tissues for the treatment of clinical/pre-clinical Alzheimer's disease, Down's syndrome or pre clinical cerebral amyloid angiopathy.

Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/reverse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is the heavy chain of a humanised monoclonal antibody, Hu266, based on the mouse antibody 266.

   The sequence is that of the reshaped CAMPATH-1 heavy chain antibody. Reshaped CD4 antibody can be used to induce tolerance against an antigen. It can also be used to alleviate autoimmune diseases such as rheumatoid arthritis, and to prevent graft rejection. Tolerance to a graft, e.g. an organ graft or a bone marrow transplantation can also be useful to alleviate allergies. Tolerance to alleview allergies of the achieved. See also AMR22754-R22763.

This amino acid sequence represents the heavy chain of humanised anti-CD23 (FCERII) monoclonal antibody Cl1, composed of a human framework (HSIGKVII) and the heavy chain complementarity determining regions (see AA73257-59) of murine antibody Cl1. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies we used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, cliabetes, uveitis, dermatitis, psoriasis, uriticaria, nephrotic syndrome, glomerulonephitis, inflammatory bowel disease, ulcerative collitis, Crohn's disease, Sjogren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic execebation, rhinitis,
   receptor specific antibodies useful for treating e.g. arthritis,
   eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type 1 diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and

WPI; 2001-626437/72. N-PSDB; AAD20745.

Novel isolated tumor-associated antigen mucin-1-specific binding member for diagnosing and treating cancer, comprises mucin-1 binding domain or its portion for binding to an epitope of the protein core of mucin-1

Claim 12; Page 106-108; 126pp; English

The invention relates to an isolated tumour-associated antigen mucin-1 (MUC-1)-specific binding member comprising an antigen binding domain

```
cc region having an antibody variable light (VL) or heavy (VH) region,

or a complementarity determining region (CDR) of VL or VH. MUCI-specific

CD binding member is useful for diagnosing cancer, preferably adenocarchnoma

CT he binding of MUCI-specific binding member to MUCI is detected by a

detection method selected from enzyme-linked immunosorbent assay,

CC magnetic resonance imagning, solintillation counting, and X-ray film.

CMUCI-specific binding member is useful for treating cancer, preferably

adenocarchnoma, in an individual, where the cancer is present in tissue

CC the breast, ovary, lung, or bladder of the individual. MUCI-specific

CD binding member is useful for diagnosing and imaging MUCI-sepressing

cancer cells and tissues, for purifying or isolating non-glycosylated,

CC underglycosylated or cancer-associated forms of MUCI or MUCI epitope-

CC containing molecules, and for therapeutically or prophylactically

C treating cancer. The present sequence is human recombinant immunoglobulin

CC (Ig) heavy chain region (variable VH and CH constant heavy chain).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Location/Qualifiers 1..1437 AAV35487 standard; DNA; 1437 BP. 29-SEP-1998 (first entry) Macaca fascicularis. WO9819706-A1 AAV35487;  N

Hanna N;

This sequence encodes a primatized form of the antibody 786 heavy chain from macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method sequence of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocycopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflimantory bowel disease, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumnours. Optionally the NAb can be conjugated to a drug or toxin. MAb's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAb sa ree optionally combined with other proteins or small molecule immunosuperssants. Blocking B7/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and suit inhibits production of interleukin-2 (IL-2), T cell proliferation and suit inhibits antigen-specific immunosuppression, i.e. it inhibits antigen-specific immunosuppression and New monoclonal antibodies specific for B7.1 or B7.2 antigens and inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between T and B for treating anseases controlle, e.g. graft rejection or tumours Example 7; Fig 4b; 87pp; English. Brams P, WPI; 1998-286601/25. P-PSDB; AAW63763 Anderson DR,

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD86) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, a motification of transportopenia purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's callesses and ulcerative colitis, food-related allergies e.g. migraine, rhinitis and eczema, and other types of allergies. The present nucleic acid sequence encodes the heavy chain of T86, a primatised antibody we have the present nucleic used in the invention to induce apoptosis.
neuroprocective, apoptosis inducer, allergy; CD28 receptor antagonist, B71 antigen; CD86; B cell cancer; metastasis; tumour; B cell lymphoma; B cell leukaemia; autoimmune disease; graft-vs-host disease; immunosuppression; organ rejection;
  Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

  2 DNA sequences (AAT62511 and AAT13847) respectively code for primatised forms (AAW01819) and AAW01820) of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 786. Cloned 786 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibodies have also been produced (see also AAW01817-18 and AAW01821-21). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

  The present sequence is that of bicistronic chimeric idiotype plasmid VR1623, which includes the cytomegalovirus immediate-early promoter, enhancer and 5' untranslated sequences, driving the expression of mouse chimeric immunoglobulin light and heavy chain coding sequences. The transcriptional terminator region includes polyA and termination signals from the bovine growth hormone gene. The plasmid expresses a functional chimeric idiotype immunoglobulin that stimulates a partially protective B and T cell response to that stimulate a partially protective B and T cell response to AAF30313) encoding a secreted form (see AAB20187) of mouse Fms-like tyroshne kinase (Flb-3 lighand), demonstrated the ability of the present invention to enhance protection from tumour challenge in a

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The CDNA sequences have been derived from a variety of human tissues. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producting proteins from these polymucleotide sequences. The proteins are useful for identifying compounds that modulate expression of the polymucleotide sequences compounds that modulate expression of the polymucleotide sequences compounds the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. cancers), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis).

The polymucleotide sequences of the invention are slow as also useful in gene therapy. AAS62214 AAS62838 represent the CDNA sequences of the themson in that encode for novel human secreted proteins.

  EBV-transformed cell lines and mouse-human heterohybridomas producing human Mabs specific for the gg120 V3 loop of HIV-1 MN isolate were obtained. Mab 447-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Abterminant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain V region was derived from 447-52D and to which a signal sequence and a H chain intronic sequence are appended, fueed to a fragment contig. a short intronic segment of the human gamma 1 encoding domain in its genomic form.

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, culnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, or proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB55007 represent sequences used in the exemplification of the present
  Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer -
immunomodulatory, muscular; gynaecological; gastrointestinal; nephrotropic; antiinfective; antibacterial; gene therapy; wound; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; reproductive disorder; gastrointestinal disorder; renal disorder; infectious disease; cardiovascular disorder; ss.

  5, 2003, 19:47:34; Search time 65.1566 Seconds (without alignments) 6735.375 Million cell updates/sec
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents a single chain antibody of the invention The specification describes a substance can inhibit the binding between hepatitis C virus (HVV) and cells with potential HVV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV BZ/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope glycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment and/or prevention of hepatitis C, or for diagnosis of hepatitis C.
